

THE ONLY POST-EMERGENT HERBICIDE REGISTERED FOR BROADLEAF WEED CONTROL IN CHICORY BASED PASTURES.

An application of 2.0 L/ha Nufarm Thistrol Gold with 0.5% v/v CanDo Adjuvant is now registered for use on chicory as a component of grass, clover and medic pastures.

Nufarm Thistrol Gold's unique triple active ingredient combination is the only post-emergent herbicide registered for use on chicory based pastures to provide early and effective control of more than 40 broadleaf weeds.

Chicory, medic, clover and ryegrass pasture.

Photos taken 6 weeks after application of 2 L/ha Thistrol Gold and 2 weeks after heavy grazing (simulated).

Best weed control is achieved on small, actively growing plants. Crop effect can also be mitigated by applying to chicory from 5-6 leaf, with the following symptoms sometimes observed:

Some reddening of the leaves at around two weeks after application.

Some necrosis of the leaves around four weeks after application.

Chicory recovery and regrowth at around 8 weeks after application.

DO NOT apply Nufarm Thistrol Gold to pastures containing chicory if weather forecasts are predicting a period of frosts or temperatures above 30°C. The combination of environmental stress and herbicide application may result in unacceptable plant injury or death.

Nufarm Thistrol Gold will provide a registered option for broadleaf weed control in chicory based pasture and is far softer than unregistered alternatives that provide reasonable weed control:

2.0 L/ha Thistrol Gold + 0.5% Banjo at 21 days after application.

1.0 L/ha Tigrex at 21 days after application.
